

CL34 Regulator

**Commercial and Industrial Regulator** 

Appropriate for commercial and industrial applications where very accurate pressure control is required such as "fixed-factor" metering applications or large boiler and furnace applications.

## Description

The CL34 is a constant pressure loaded regulator for use where closer PSIG to PSIG regulation is desired than can be obtained from conventional spring loaded regulators. Since it requires an inlet pressure supply of only 1/2 PSIG above outlet pressure, this unit can be used where demand type loading will not meet the low pressure differential.

#### » CL34 Internal registration

Internal registration (no control line required)

#### » CL34-M

Equipped with closed-throat and control line tap for remote downstream control (external registration)

#### » CL34-IM

Equipped with an internal monitor orifice; internal registration (no control line required)

#### » CL34-IMV

Equipped with an internal monitor orifice plus vent hole option for monitor warning indication; Internal Registration (no control line required)

All versions are available with either –1 or –2 pilot:

- » #1 pilot for 5" w.c. to 5 PSIG outlet pressure (Model Name Example: CL34-1)
- » #2 pilot for 1 PSIG to 60 PSIG outlet pressure (Model Name Example: CL34-2)

#### **Benefits**

- » Economical
- » Light weight
- » Accurate pressure control for "fixedfactor" measurement applications
- » No special start-up procedures required

- » Internal monitor version eliminates the need for external relief valves or separate monitoring devices
- » No special tools required for outlet pressure adjustment
- » No minimum differential pressure requirement

#### **Features**

- » Constant loaded pilot design ("fixed-factor" pressure control)
- » Interchangeable brass orifice
- » 78 in<sup>2</sup> of diaphragm area
- » Spring-loaded pilot internal relief valve assembly
- » Field interchangeable pilot adjustment spring
- » Controlled internal bleed hole eliminates pulsation
- » Wide range of valve body sizes including NPT and flange connections
- » 16 different available assembly positions

One regulator per box Box weight: 34 lbs. (NPT) 42 lbs. (Flange)

## **OPERATING TEMPERATURE RANGE**

- -20°F to 150°F
- Silicone valve seats available for applications below -20°F

### **ADDITIONAL SPECIFICATIONS**

Maximum Capacity	60,000 SCFH (see capacity tables)		
Available Pilot Vent Sizes	3/4"		
Loading Ring Position			
M & D Models	0 degrees		
All Other Mandala	<50 PSIG inlet pressure: 15 degrees (6 notches)		
All Other Models	>50 PSIG inlet pressure: 21 degrees (8 notches)		
Other Available Options	Seal wire to indicate unapproved tampering		
_	1/8" pipe plug tap on upstream side of valve body		
	Pilot supply line filter (contact ROOTS Regulators, Owenton, KY)		
	Stainless steel supply line fittings		
	Internal monitor test tap		

## **CONSTRUCTION**

ROOTS Regulators takes pride in delivering American made products with the utmost concern for safety, quality, and customer satisfaction.

Construction material	
Valve body	High tensile strength cast iron (ASTM A-126, Class A)
Orifice	Brass (standard), Aluminum available on main orifice only
Internal monitor orifice	Brass (ASTM B16, Alloy 360)
Valve seat	Buna-N or silicone (for temperatures below -20°F)
Valve stem	Plated steel (AISI 1215)
Valve stem bushing	Stainless steel
Lever pin	Stainless steel (Type 303)
Lever	Zinc and dichromate plated steel (AISI C1010)
Stem Guide	Stainless steel
Upper diaphragm plate	Zinc and dichromate plated steel (14 gage steel)
Lower diaphragm plate	Die cast aluminum (ASTM B-85 Alloy SC84A)
Diaphragm	Buna-N and nylon reinforcing fabric
Vent screen	Stainless steel
Adjustment ferrule	Plated steel
Main & pilot seal cap	Die cast aluminum (ASTM CS43A)
Diaphragm case	Die cast aluminum (ASTM B85 Alloy SC84A)

# **VALVE BODY SIZES (INCHES)**

Inlet	Outlet	Screwed (NPT)	Flanged (ASA 125)
1-1/4	1-1/4	Х	
1-1/4	1-1/2	Х	
1-1/4	2	Х	
1-1/2	1-1/2	Х	
1-1/2	2	Х	
2	2	Х	Х
3	3		Х

Note X indicates that the valve body is available in that configuration.

#### CORRECTION FACTORS FOR NON-NATURAL GAS APPLICATIONS

The CL34 may be used to control gases other than natural gas. To determine the capacity for gases other than natural gas, multiply the values within the capacity tables by a correction factor. The table below lists the correction factors for some of the more common gases:

Gas Type	Specific Gravity	Correction Factor (CF)
Air	1.00	0.77
Butane	2.01	0.55
Carbon Dioxide (Dry)	1.52	0.63
Carbon Monoxide (Dry)	0.97	0.79
Natural Gas	0.60	1.00
Nitrogen	0.97	0.79
Propane	1.53	0.63
Propane-Air-Mix	1.20	0.71

To calculate the correction factor for gases not listed in the table above, use the gases' specific gravity and insert it in the formula listed below:

Where:

SG1 = Specific gravity of the gas in which the capacity is published.

SG2 = Specific gravity of the gas to be controlled.

#### **Wide Open Flow Calculations**

For wide-open orifice flow calculations use the following equations:

For

 $\frac{p_1}{p_2} < 1.89$  use:  $Q = K\sqrt{P_2(P_1 - P_2)}$  For  $\frac{p_1}{p_2} > 1.89$  use:  $Q = \frac{KP_1}{2}$ 

Where: P1 = Absolute Inlet Pressure (PSIA)

Q = Flow Rate (SCFH)

P2 = Absolute Outlet Pressure (PSIA) K = Orifice Coefficient (SCFH/PSI)

## **CL34 PERFORMANCE CURVES**

#### **5 PSIG Set Point**

Type and model	CL34-2
Inlet size	2-inch NPT
Outlet size	2-inch NPT
Orifice size	1/2-inch

All test results are reported at a base of 14.7 PSIA at 60° F and with 0.6 S.G. gas.

Regulator set at 5 PSIG for relief and performance testing with 40 PSIG inlet pressure @ 200 SCFH flow rate.

#### 15 PSIG Set Point

Inlet size	2-inch NPT
Outlet size	2-inch NPT
Orifice size	1/2-inch

All test results are reported at a base of 14.7 PSIA at 60° F and with 0.6 S.G. gas.

Regulator set at 5 PSIG for relief and performance testing with 40 PSIG inlet pressure @ 200 SCFH flow rate.

### **CL34 INTERNAL MONITOR (IM)**

A. Standard regulator and upstream monitor orifice.

B. Standard regulator orifice failed; upstream monitor orifice control.

C. Main orifice failed - upstream monitor orifice lock-up.

D. V option - vents a small volume of gas to atmosphere through relief valve.

Inlet pressure

Outlet pressure

#### PRINCIPLE OF OPERATION

- **A. Normal operation**. The internal monitor IM orifice performs like a standard regulator and monitor regulator in that main orifice and valve seat actuate to control outlet flow and pressure under normal flow conditions. If there is no demand, the main seat *and internal monitor orifice will close*.
- **B. Monitor operation**. If the main valve seat fails to control the gas flow and pressure due to foreign matter between the seat and orifice face, or if the seat is eroded, the internal monitor orifice automatically goes into operating position at a slightly at a slightly higher outlet pressure (see Internal Monitor Lock-up Pressure table). Any time the pressure on the main diaphragm exceeds the force of the fixed monitor spring, the increased outlet pressure causes the main valve seat to push against the sliding orifice. The sliding orifice compresses the monitor spring and positions the monitor orifice to control the gas flow. The IM orifice now functions as a monitor regulator and continues to monitor as long as the main seat fails to control at the normal adjusted outlet pressure. If the gas load demand is increased beyond the internal monitor's capacity, the outlet pressure is reduced to normal adjusted pressure and the regulator resumes normal regulation.
- **C. Monitor lock-up**. If the demand for gas is decreased to zero flow during monitor operation, the sliding orifice continues to close until its orifice is in the gas tight position (monitor lock-up) against the BUNA-N monitor valve seat. (See the Internal Monitor Lock-up Pressure table for the outlet pressure required for internal monitor lock-up.)
- **D. Vent hole V option**. On installations where a small volume of over-pressure gas can be safely vented to the atmosphere, the advantages of both the pilot relief valve and monitor safety can be combined. If the flow is decreased to zero or just greater than zero, the vent hole in the internal monitor orifice allows gas to slowly bleed downstream and cause the pressure to rise to the relief point of the pilot's internal relief valve. The gas then bleeds to the atmosphere indicating a problem with the regulator.

15 PSIG	Blue	15.6 PSIG		
20 PSIG	Blue	20.6 PSIG		
25 PSIG	Blue	25.7 PSIG		
30 PSIG	Silver	31.2 PSIG		
35 PSIG	Silver	36.5 PSIG		
40 PSIG	Silver	41.5 PSIG		
50 PSIG	Silver	51.5 PSIG		
60 PSIG	Silver	61.7 PSIG		

Note The above tests were conducted using a 0.1-inch diameter nylon rod glued to the valve seat.

<sup>\*</sup>The internal monitor lock-up pressure refers to the outlet pressure necessary to close the internal monitor valve in the event there is no downstream demand.

# CL34 SERIES COMMERCIAL REGULATOR, MODELS 1IM AND 2IM

Capacity Table (1% Absolute Droop\*)

Capacities in 1000 SCFH (m $^3$ /hr) of 0.6 S.G.; base conditions of 14.7 PSIA and 60 $^\circ$ F.

#### Typical Capacity Info.

Manufacturer	ROOTS Regulators
Type and model	CL34-1IM, CL34-2IM

#### **VENT LINES FOR REGULATORS**

When constructing vent lines to be attached to regulators installed indoors, follow a few basic rules:

- a. Never use pipe sizes smaller than the vent size; smaller pipe sizes restrict the gas flow. If a long gas run must be used, ROOTS Regulators advises increasing the pipe one nominal size every ten feet to keep the flow restriction as low as possible.
- b. Keep the vent line length as short as possible to minimize the restriction and reduce the vent's tendency to cause regulator pulsation.
- c. Support the vent pipe to eliminate strain on the regulator diaphragm case.
- d. Always point outdoor vent pipes in the downward position to reduce the possibility of rain, snow, sleet, and other moisture entering the pipe. Install a bug screen in the end of the pipe.
- e. Do not locate the vent line terminus near windows, fans, or other ventilation equipment. See the installation instructions furnished with the regulator.
- f. Adhere to all applicable codes and regulations.
- g. If your vent pipe causes regulator pulsation, consult your sales representative or manufacturer.
- h. ROOTS Regulators strongly recommends running a separate vent line for each regulator. Headers with various installed devices can cause regulator malfunction.

**Caution** Ensure the end of the vent line is away from ANY potential ignition sources. It is the installer's responsibility to ensure the vent line is exhausting to a safe environment.

#### INSTALLATION

**Warning** ROOTS Regulators does not endorse or warrant the completeness or accuracy of any third party regulator installation procedures or practices, unless otherwise provided in writing by ROOTS Regulators. Follow your company's standard operating procedures regarding the use of personal protection equipment (PPE). Adhere to guidelines issued by your company in addition to those given in this document when installing regulators.

- a. Remove all shipping plugs from the regulator inlet, outlet, and vent before installation.
- b. Verify the piping interior and regulator inlet and outlet are clean and free of dirt, pipe dope, and other debris. Dirt and other foreign materials entering the regulator can cause a loss of pressure control.
- c. Apply pipe joint sealant to the male pipe threads. Do not use pipe joint material on the regulator's female threads. Joint sealant could become lodged in the regulator and cause a loss of pressure control.
- d. Gas must flow through the regulator's valve body in the direction cast on the regulator body. Gas flowing in the wrong direction can overpressure and cause damage to the regulator.
- e. The pilot diaphragm casing can be mounted in any position relative to the body through a full 360° angle at 90° increments.
- f. When the regulator is installed OUTDOORS, the vent must always be positioned so that rain, snow, moisture or foreign particles cannot enter the vent opening. ROOTS Regulators recommends positioning the pilot vent downward to avoid entry of water or other matter which could interfere with the proper operation of the regulator. The vent should be located away from building eaves, window openings, building air intakes and above the expected snow level at the site. The vent opening should be inspected periodically to insure it does not become blocked by foreign material as outlined in DOT PHMSA-RSPA-2004-19856.
- g. When the regulator is installed INDOORS, the vent must be piped to the outside atmosphere using the shortest length of pipe, the fewest possible pipe elbows, and a pipe diameter as large as the vent size or larger. USING VENT PIPE SMALLER THAN THE VENT CONNECTION LIMITS THE REGULATOR'S INTERNAL RELIEF VALVE CAPACITY. The outlet end of the pipe must be protected from moisture and the entrance of foreign particles. The regulator should be specified by the user with the size vent and pipe threads desired to make the vent pipe connection.

#### START-UP PROCEDURE

- a. Mount a pressure gauge downstream of the regulator to monitor the downstream pressure.
- b. With the downstream pressure valve closed, slowly open the inlet valve. The outlet pressure should rise to slightly more than the setpoint. Verify there are no leaks and all connections are tight.
- c. The regulator was pre-set at the factory to match order specifications. If necessary, adjust the outlet pressure by removing the seal cap on the top of the pilot spring housing and adjusting the ferrule or screw inside the pilot spring housing using a large flat-head screwdriver. With a small amount of gas flowing through the regulator, rotate the pilot ferrule clockwise to raise the outlet pressure or counter-clockwise to lower the outlet pressure.
- d. Replace the seal cap and check for leaks after the desired outlet pressure is achieved.

The regulator is ready for operation.

#### CL34 OPERATOR AND MONITOR INSTALLATION SCHEMATIC

- 1. Gage tap shut-off valve
- 2. Upstream isolation valve
- 3. Model CL34IM
- 4. Model CL34

- 5. Downstream isolation valve
- 6. Reducer (minimum 1 pipe size larger than regulator valve body)
- 7. Downstream sensing line (1/2" minimum)

#### OPERATOR/MONITOR START-UP PROCEDURE

- a. Mount a pressure gauge between the downstream regulator (4) and the downstream shut-off valve(5) to monitor the downstream pressure.
- b. With the downstream pressure valve closed, slowly open the upstream shut off valve (2). The outlet pressure should rise to slightly more than the set-point. Verify there are no leaks and all connections are tight.
- c. Monitor the set-point adjustment
  - 1. To adjust the monitor's set-point, induce some amount of flow through both regulators. (CL series regulators are set at the factory with 200 SCFH of 0.6 S.G. qas.)
- d. Remove the operator's pilot spring cap (do not remove main spring cap). Using a large flat-head screwdriver, slowly rotate the threaded adjustment ferrule clockwise. Continue to rotate the ferrule until the outlet pressure is greater than the desired monitor set pressure. In some cases, this may require the temporary use of a heavier pilot spring.
- e. Remove the monitor's pilot spring cap (do not remove the main spring cap). Rotate the adjustment ferrule until the desired monitor set pressure is reached (rotate the adjustment ferrule clockwise to increase pressure; rotate the adjustment ferrule counter-clockwise to decrease pressure).
- f. Decrease the flow through both regulators to zero then return the flow to the previous value. If the downstream pressure has changed from the desired value, repeat previous step. Replace the monitor's pilot spring cap.
- g. Operator set-point adjustment:
  - 1. To adjust the operator's set-point, rotate the adjustment ferrule counter-clockwise until the desired downstream operator set pressure is reached.
- h. Decrease the flow through both regulators to zero then return the flow to the previous value. If the downstream pressure changed from the desired value, repeat the previous step. Replace the operator's pilot spring cap.
- i. Both regulators are now set for continuous operation.

#### MONITOR FIELD CHECK

- a. To check the monitor regulator's operation, remove the operator's pilot spring cap.
- b. Push down on the pilot stem until the downstream pressure rises to the monitor's set-point. The monitor will begin throttling, assuring its proper operation. If the pressure continues to rise above the monitor set-point, the monitor is not functioning properly. Consult the ROOTS Regulators Owenton KY factory, if necessary.

#### SAFETY WARNING

This product, as of the date of manufacture, is designed and tested to conform to all governmental and industry safety standards as they may apply to the manufacturer. The purchaser/user of this product must comply with all fire control, building codes, and other safety regulations governing the application, installation, operation, and general use of this regulator to avoid leaking gas hazards resulting from improper installation, startup or use of this product.

ROOTS Regulators strongly recommends installation by a qualified professional and periodic inspection of pressure regulators (inspections may be required by local applicable codes or regulations).

Inspections should include checking for gas quality, cycle numbers, external environmental changes, and operating conditions that impact wear on the regulator's moving parts. To ensure safe and efficient operation of this product, replace worn or damaged parts found during inspection.

## **Limited Warranty**

ROOTS Regulators are subject to the terms and conditions of the Natural Gas Solutions North America, LLC General Terms & Conditions For Sale of Products, Parts and Services, and no other terms shall apply, unless agreed upon by the parties in writing. The Natural Gas Solutions North America, LLC General Terms & Conditions For Sale of Products, Parts and Services can be found on the Dresser Utility website: dresserutility. com/forms-questionnaires-and-terms-conditions-sale.

## **Ordering Information**

Specify:

- Inlet and Outlet Connection Size and Type
- 2. Model Number
- 3. Outlet pressure desired
- 4. Pilot needed
- 5. Inlet pressure range
- 6. Type of gas and maximum capacity required
- 7. Assembly position number (see chart below)
- 8. Special requirements such as tagging, 1/8" pipe plug tap, seal wire, etc.
